VORONOI-CORE

A Voronoi rib lattice with recessed cells.

THE DESIGN

Irregular Voronoi cells become 2.6 mm ribs with rounded crests, and the cells between the ribs are recessed about 1 mm. The result is a net of ridges your fingers can follow, with no sharp edge anywhere.

THE HANDLE

A sleeve that slides over your paddle's flat handle: a 30.2 × 16 mm slot (the 30 mm wide handle plus 0.2 mm, 16 mm thick), 130 mm deep so the paddle seats fully, with a solid 5 mm base and a counterbored 3.5 mm hole that takes a low-head M3 cap screw flush. The head is solid, with both short side walls of the slot slit open at the top so the flared throat of the paddle slides in smoothly; a sealed hollow core lightens the rest. The outer shape is the same on all ten designs.

DESIGN INSPIRATION

Dragonfly wings, leaf veins and cracked earth: the same branching cells appear wherever nature needs strength with little material. Here the ribs give your fingers a net of ridges to hold.

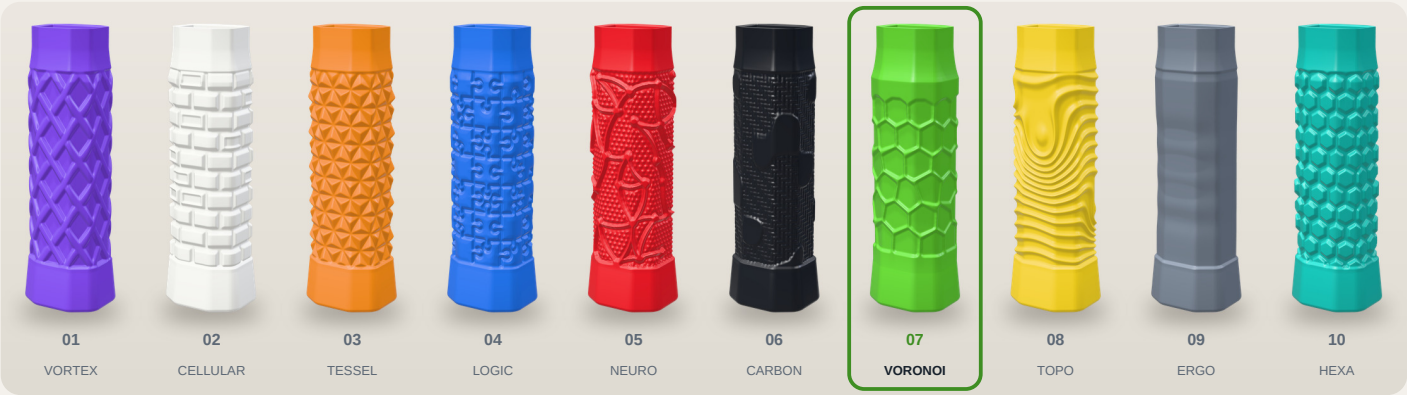

WHY IT GRIPS

- 54 recessed cells in a 76 mm band
- 2.6 mm ribs standing at the full 3.5 mm crest
- Cell floors sit about 1 mm below the rib crests

PRINT TIP

Rib flanks rise at no more than 45°, so no supports are needed.

THE WHOLE COLLECTION

The paddle in the illustration is generic, drawn with your 30 × 16 mm handle. Every design prints in any of the ten PLA colours shown on page 1. 100 % infill · 0.20 mm layers · upright, butt end down.
